

Order for Recovery Automation

£29.99 Fixed-Price Service — Developer Workflow + AI Intelligence Specification

Scope: This product handles **in-time applications only**. The customer uploads the Order for Recovery (OFR); AI validates and classifies it, selects the correct statutory form route, and extracts the data needed. The customer—not the AI—selects the truthful statutory ground.

1. Customer Journey

UPLOAD OFR → AI VALIDATES DOCUMENT → AI CHECKS IN-TIME STATUS → AI SELECTS FORM ROUTE → CUSTOMER SELECTS TRUE STATUTORY GROUND → MINIMUM FOLLOW-UP QUESTIONS → CONFIRMATION → £29.99 → FORM COMPLETION / INTERNAL PROCESS

The customer should not be asked whether their case is parking, moving traffic, Dart Charge, Mersey Gateway, Clean Air Zone or which court form they require. Classification happens behind the scenes.

2. Absolute In-Time Gate

This automation is strictly for in-time OFR responses. AI must identify the OFR date/deadline and determine whether the response remains in time.

IN TIME: continue. OUT OF TIME: stop the automated purchase/workflow and direct the customer to the appropriate expert/out-of-time service.

TE7 and PE2 are not part of this product. The system must not generate them or silently convert an out-of-time case into an out-of-time application.

3. What AI Must Read and Extract

- **Document type** — confirm the upload is an Order for Recovery.
- **Issuing / charging authority.**
- **PCN / penalty reference.**
- **Vehicle registration.**
- **Order for Recovery date and stated response deadline.**
- **Amount outstanding.**
- **Contravention / charge / scheme type** where shown.
- **Location / authority indicators** needed to distinguish London and non-London routes.
- **Scheme indicators** such as Dart Charge/Dartford Crossing, Mersey Gateway/Merseyflow, or Clean Air Zone.
- **Underlying enforcement regime and correct form family**, where reliably determinable.
- **Any sign the uploaded document is not the current OFR or is otherwise unsuitable for this in-time workflow.**

4. AI Form Routing

AI must select the correct form from the document and applicable enforcement route. It must **not** use a simplistic rule such as 'parking = TE9 and all moving traffic = PE3'.

Case identified	Backend route
Parking / applicable TE9 cases	Standard TE9
Applicable current non-London moving-traffic cases	Standard TE9
Dart Charge / Dartford Crossing	Special road-user-charging TE9

Case identified	Backend route
Mersey Gateway / Merseyflow	Special road-user-charging TE9
Clean Air Zone route using the HMCTS special TE9	Special road-user-charging TE9
Applicable London moving-traffic / other PE3 cases	PE3 statutory declaration

If AI cannot determine the correct statutory form reliably, it must route the case to human review rather than guess.

5. Standard TE9 — Customer Grounds

After AI selects standard TE9, show the statutory choices in clear customer language. The customer selects the ground that is true.

Ground 1 — I did not receive the original PCN / Notice to Owner.

No factual explanation is required merely to use this ground. No unnecessary follow-up questionnaire.

Ground 2 — I made representations in time but did not receive a Notice of Rejection.

Ask only: *Approximately when did you make your representations?* Optional evidence upload.

Ground 3 — I appealed through the applicable tribunal/adjudicator route.

Ask only the minimum follow-up required by the official form/ground, including approximate appeal date where useful. Optional evidence upload.

Ground 4 — I paid the penalty charge in full.

Collect the payment information required by the official form, including date, method and recipient/payee as applicable. Optional proof-of-payment upload.

6. Special TE9 — Dart Charge, Mersey Gateway & Applicable CAZ Cases

AI must recognise these schemes and select the **special HMCTS TE9**, not the ordinary parking TE9.

Customer-facing choices remain simple:

- **I did not receive the PCN.** No unnecessary explanation.
- **I made representations in time but did not receive the required rejection response.** Ask approximate date; evidence optional.
- **I appealed to the adjudicator.** Only after selection, show the relevant sub-choice(s) required by the official form, such as no response, appeal not determined at the relevant time, or appeal determined in the customer's favour.
- **I paid the penalty in full.** Collect the payment details required by the official form; proof optional.

The adjudicator sub-options are **not separate top-level grounds**. They appear only after the customer selects the adjudicator/appeal ground.

7. PE3 Route

Where AI identifies PE3 as the correct route, show only the statutory grounds applicable to that PE3 case. Typical customer-facing choices include non-receipt of the PCN, representations made without the required rejection response, and the applicable adjudicator-appeal ground.

Ask only the minimum additional factual information required for the selected ground. Evidence uploads should normally be optional unless a specific operational requirement makes evidence essential.

8. PE3 Internal Human Review & Solicitor Process

PE3 is not automatically released to the customer as the final fulfilment step.

After payment, AI prepares the PE3 in draft and routes it to an **internal human-review queue**. The team checks the OFR, respondent details, PCN, authority, selected statutory ground, relevant dates and form version.

The business has an authorised solicitor/witnessing process for PE3 statutory declarations. The AI must **never fabricate or automatically apply** a solicitor's signature, witnessing statement, date, certification or other act that must genuinely be performed by the authorised person.

The operational process must ensure that the statutory declaration is made/witnessed in the legally required manner before filing with TEC. The customer does not need to be sent a blank PE3 merely to arrange their own solicitor.

9. AI vs Customer Decision-Making

AI chooses the form. The customer chooses the truthful statutory ground.

AI may use document content to explain the available options and populate factual fields, but it must not decide that a statutory ground is true on the customer's behalf.

Immediately before payment/submission, require a confirmation such as: *I confirm that the information I have provided is true and that the ground I selected accurately describes my circumstances.*

10. AI Evidence Handling

- Read uploaded evidence and extract useful dates/details rather than asking the customer to retype them.
- Never treat absence of evidence as proof that a statutory ground is false.
- Never invent an appeal date, representation date, payment date or outcome.
- Where evidence conflicts with the selected ground, flag the case for human review rather than silently completing the form.
- Where a document is unreadable or incomplete, request only the minimum replacement/clarification needed.

11. Customer Details & Price

Collect only the customer details genuinely required to complete/process the statutory form and communicate with the customer. Reuse information already extracted reliably from the OFR rather than asking for it again.

Price: £29.99 fixed price for the Order for Recovery service, regardless of whether the backend route is standard TE9, special TE9 or PE3.

12. Hard Rules

- IN-TIME APPLICATIONS ONLY.
- No TE7 or PE2 generation in this product.
- Never allow an out-of-time case to proceed merely because payment can be taken.
- Never guess the statutory form.
- Never ask the customer to identify the legal form or enforcement regime.
- Never allow AI to choose the customer's statutory ground.
- Never invent facts, dates, signatures, witnessing details or evidence.
- Use the current official form version and map every required field from that form.
- Do not add narrative explanations where the statutory form does not require them.
- PE3 requires mandatory human review and the genuine authorised witnessing process.
- Where classification, deadline or form applicability is genuinely uncertain, route to human review.

13. Recommended AI Implementation

No bespoke fine-tuning is required for the initial build. Use a capable document/vision model with a strict system instruction and structured internal output.

Suggested internal fields include: **document_type**, **authority**, **pcn_reference**, **vehicle_registration**, **ofr_date**, **deadline**, **in_time**, **scheme**, **contravention_category**, **london_or_non_london**, **enforcement_regime**, **form_route**, **customer_ground**, **supporting_dates**, **evidence_facts**, **confidence**, **human_review_required**.

The customer should never see this technical classification layer.

14. Testing Before Launch

Test against a representative set of genuine OFRs covering parking, London moving traffic, current non-London moving traffic, Dart Charge, Mersey Gateway, Clean Air Zone and PE3 routes. Include near-deadline, clearly out-of-time, poor-quality scans and documents that are not OFRs.

Testing must verify: document recognition, deadline calculation, correct form selection, correct ground display, field mapping, evidence extraction, stop rules, PE3 human-review routing and prevention of invented information.

Final Developer Principle

Keep the customer experience tiny and the backend intelligence explicit. The customer uploads the OFR and tells us which truthful statutory circumstance applies. AI handles document reading and routing; prescribed legal choices, deadline rules and human-review safeguards control the rest.
